Subject: Re: qa testing for a new fb4a dialog

Agree that we'd have some things to figure out there – the main goal would be to improve the development time experience apps don't end up in the store with a dialog that doesn't function (which is the case with at least one iOS 6 app). Let's defer that until the next release.

Do you agree we should fix the flashing spinner problem?

Eddie

Cc: Ling Bao <lingzbao@fb.com>, Mike Vernal <vernal@fb.com>, Vladimir Fedorov <vladf@fb.com>
Subject: Re: qa testing for a new fb4a dialog

I am going to push back on this proposal for a couple of reasons:

1. We are trading off development time usability for an error case for a runtime perf hit. The apps that we whitelist (presumably marquee partners) will need a round trip before showing the dialog. This is a development time error and the app will never work so I think the current behavior is fine as long as we give a clear error message to developers and our docs call these cases out.
2. We keep changing these business rules all the time (we changed them a few times during the iOS6 project) so I really don't want to apply any of these on the client – I think that may get us in a corner later.

Thanks

Vish

Subject: Re: qa testing for a new fb4a dialog

That's fine. P2. The thing I care about is the static permissions -- we shouldn't show that loading dialog unless there is a permission that we don't have in a static array in the SDK or login service (which every is easiest to change).

On Dec 4, 2012, at 11:26 PM, "Eddie O'Neil" <ekoneil@fb.com> wrote:

If the whitelist size is small, it's not nuts and would be a good improvement to the development experience, even if the error only happens in sandbox mode. Hopefully this isn't an issue at all for users.

We've got bigger fish to fry this week before launch, so suggest that push that to the next FB4A.

Subject: Re: qa testing for a new fb4a dialog

Also, and this may be nuts, but can we check to see if the app is white listed to ask for read and write together at app startup and then throw an error if they are not, before the user sees the dialog?

On Dec 4, 2012, at 10:41 PM, "Eddie O'Neil" <ekoneil@fb.com> wrote:

Agree with Doug. Let's optimize for the (very) common case where we know all the permissions and don't have to make an API call to load them.

Subject: Re: qa testing for a new fb4a dialog

Also, can we only show the "loading text" screen if it is a permission that we don't know about statically?

I am only asking for basic and I see the spinning dialog for a little bit. I am on a fast S3 too.

Subject: Re: qa testing for a new fb4a dialog

This could be a question about the test app...

1. I can't seem to see what the behavior is when I already granted the app requested permission. It keeps showing the dialog.

>> by design since there's no server roundtrip. So dialog doesn't know it shouldn't show

What Ling says. It is the responsibility of the SDK to figure out which permissions have already been granted and just ask for the delta perms.

2. The NUX keeps showing up too for the same app through N installs. If I switch between apps, it stops showing the NUX after I TOS the 3rd app.

>> new test app lets you auth up to 3 apps. On the 3rd app, nux disappears. Note known issue: <https://our.intern.facebook.com/intern/tasks/?t=1937105>

Note that for the same app, basic_info will be asked only once by the SDK and so the NUX will be shown only once.

In terms of the GDP itself...

1. When I pop the GDP again, the dialog flickers -- it shows the progress dialog from the previous install (the spinning circle) -- and then it shows the GDP.

>> the loading indicator happens due to server hit to decide whether to show NUX. When you're no longer eligible for NUX, a bit is cached and there's never a server hit / load for standard scopes

Not quite true. We fetch the NUX status when the user logs in so this is not the reason. You may be hitting a bug that Adrian is fixing by tomorrow due to which some friend perms incur a server round trip to get the text. In general the dialog logic calls into the sentence rendering logic which may or may not finish synchronously (depending on whether all the perms are known or not). For the known perms case the spinning circle should go away instantaneously.

2. What is the point of the Cancel button on the progress dialog after the GDP dialog? I don't think we have anything like that on iOS?

>> agree but probably doesn't meet bar for fb4a at this point. Can consider in Jan

3. Are we planning on throwing an error if the developer asks for both read and write at the same time? I can do it right now in the test app.

>> since there's no server roundtrip, we can't throw error at dialog render time since we need to check server gk to see if the app is whitelisted for this. However, any dev that tests this will notice it fails because unless whitelisted, the call errors even if user clicks OK

All these install "business" rules are checked only on the server after the user clicks OK for maximum flexibility. This is the same way iOS behaves. The caller should get a clear error for this case.

@Noorin – really good additional test cases for gdp w/
new test app

1/ after seeing nux in two app ids, no nux appears in 3rd
app id

2/ things work properly and copy looks correct for top 10
most popularly requested permissions:

- Email ('email address' should be copy in dialog)
- Publish_actions ('post ... on your behalf')
- user_birthday ("your birthday")
- publish_stream ('post ... on your behalf')
- user_likes ("your likes")
- user_location ("your location")
- user_photos ("your photos")
- Friends_birthday ("your friends' birthdays")
- friends_photos ("your friends' photos")
- user_interests ("your interests")

Subject: Re: qa testing for a new fb4a dialog

Is the QA team clear on what the different permissions are (read/write/unknown)? Some interesting permission combinations to test for are:

Scenario 1

1. App asks for basic_info
2. App asks for email,
user_about_me,
friends_about_me,
user_actions:spotify
3. App asks for publish_actions
4. App asks for manage_pages

We should do this scenario with changing the write_privacy level in step 3 to be friends, everyone or only-me

Scenario 2

Similar to scenario 1 but combine steps 1 & 2. i.e. Ask for basic_info, email, user_about_me, friends_likes in 1 step

Scenario 3

Trying to install an app without basic_info permission should fail

Scenario 4

Trying to install an app without specifying any permissions should fail

Scenario 5

Asking for publish_actions without specifying a write_privacy should fail

These are in addition to the test cases Peter mentions below.

Thanks

Subject: Re: qa testing for a new fb4a dialog

Hey Ronak and Amanda,

Attached is a test app for the new native GDP dialog. The test app has a few buttons which are equivalent to a "login with Facebook" button but specifying different requested permissions. Please test as follows:

- E2E case of asking for read perms initially, followed by write and unknown perms. You will need to un-tos the app to ensure that asking for write perms when un-tosed fails.
- Test cancel at authorization time. Verify intent response has the right error code
- Test that an error with retry option is shown when there is no network connectivity
- test when user is not logged in to fb4a. It should prompt for login and then redirect to the dialog
- rotate phone in each step and ensure the dialog adapts.

Known issues:

- fb4a will crash the first time you launch this if you launch the dialog immediately after install. This is being tracked in <https://our.intern.facebook.com/intern/tasks/?t=1920458> and the workaround is to simply open fb4a once before clicking the buttons in the 3rd party app
- testing the service doesn't work yet. The diff for that is out. If it's ok, we'll continue to add to the test app and send you updates as features land
- there will be a nux for the GDP dialog the first time it is run, but this is not in yet. This should be explicitly tested on different devices once it lands (some time Wednesday).

Please prioritize testing on gingerbread and tablets since that has had the least testing so far.

Let me know if this makes sense/if you need more details. Thanks,

-Peter
